PUBLISHED BY TRUSTEDDOCKS.COM

Dear Reader,

Docking a ship has always been a matter of trust preferably borne by a long lasting business relationship. By nature repairs sometimes require ad-hoc business decisions for new shipyard partners. Finding this partner can be a challenge.

Choosing a shipyard bears always some risk. Top quality services are needed for a reasonable budget within a certain time constraint. Hence finding the correct shipyard is a difficult task for any technical department of a shipping company. The bandwidth of work to be done reaches from simple 'shave and a haircut' jobs to complex and sophisticated conversions. Now, the shipyards are getting ready for the first wave of ballast system retrofits and scrubber installations. There are many determining criteria while the ship repair industry represents a US \$20 billion global market and is estimated to reach US\$ 40 billion by 2028.

In the course of the last decades some general rules haven been established: The U.S., Latin America and West Africa remain regions where only vessels with restricted operation in these areas will use their facilities. The West and North Europe regions are the preference for these vessels making solely transatlantic voyages. Singapore and Middle East Gulf is specializing in non-conventional fleets, gas and tanker vessels. Black sea, Turkey and especially China are dominating the bulk carrier market.

Despite these rules it is the purpose of this book to provide some market transparency for managers, owners and their superintendents in the field of ship repairs. However it is the primary intention of this book to work as an 'appetizer' for the webpage [www.trusteddocks.com](https://www.trusteddocks.com). Here you can find the same information as in the book plus valuable add-ons. Beside an endless number of small and medium sized players Hanjin Heavy Industries, Hyundai Mipo Dockyard Co., Ltd., China Shipbuilding Industry

---

Corporation (CSIC), Damen Shipyards Group and Cochin Shipyard Limited are some of the key players operating in the global ship repair and maintenance market.

---

With [www.trusteddocks.com](http://www.trusteddocks.com) you can:

- prescreen and preselect shipyards in relevant trading area
- easily calculate the deviation costs
- quickly receive docking quotations from shipyards
- directly request a docking slot from shipyards
- review shipyards and share experiences

As [www.trusteddocks.com](http://www.trusteddocks.com) is regularly updated it is not as static as a book. E.g. the number of listed shipyards will be growing and the website is also providing a valuable assessment tool. You have the possibility to evaluate the performance of the contracted shipyard and benefit from the assessments of others. It is the intention to develop [www.trusteddocks.com](http://www.trusteddocks.com) to be the 'Guide Michelin for ship repairs'. Hence, take this book as the menu.

Enjoy reading

Dr.-Ing. Ulrich Malchow, Hamburg, February 2019

**TRUSTEDDOCKS.COM**

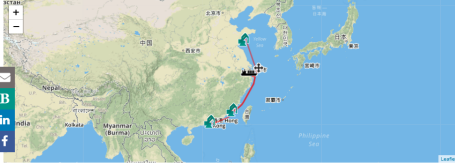

## **online shipyard search and request**

[trusteddocks.com](http://trusteddocks.com) is the ultimate online matchmaking platform, designed for vessel and fleet managers. [trusteddocks.com](http://trusteddocks.com) supports several steps in the decision making process of a ship manager and documents and archives every step of the repair or refit project.

Currently you are reading our book or e-book. The e-book is updated weekly and if you have an account for [trusteddock.com](http://trusteddock.com), you can download the E-Book free of charge whenever you want. The Book or E-Book is good to use, whenever you don't have internet connection. If you are online, it is more fun, to make use of our website, which can be accessed on your desktop or mobile device. Just specify your vessel and we show you all shipyards that are feasible for repair or refit purposes.

## **Shipyard Search & Compare & Recommend**

Compare different shipyards with each other

Every shipyard in the world is listed with their facilities, equipment, certificates and workforce in our database. Additional Datasets like weather, distances or travel information give us a full picture of the environmental conditions of every shipyard. Furthermore trusteddocks.com makes use of a global ais dataset and monitors the worldwide activities of all shipyards. So, we can say which shipyards are busy and what kind of vessels are using which shipyards. On top of this data, trusteddocks has created the first online recommendation system for shipyard. Depending on dimension, age, vesseltype and other factors we create vessel specific rankings and suggest the best option in a given region.

## Technologies to reduce NO<sub>x</sub> & SO<sub>x</sub> Emissions

It's a known fact that whenever a machine is operated to perform some work, it is impossible to achieve 100% work efficiency because of various reasons such as friction, heat dissipation etc. When it comes to ships engine, a massive mechanical structure with several moving parts, the work efficiency achieved out of it is 70-85% for suitable running condition.

The combustion of gases inside the engine emits harmful smoke into the atmosphere which leads to loss in the system and pollution of the marine environment. Annex VI of MARPOL deals with restricting the amount of harmful emissions from ships main propulsion system and provides guidelines for substances such as Sox and NO<sub>x</sub>. Several technologies have been introduced to reduce the level of harmful emissions in ships exhaust system. We have enumerated 10 such different technologies and systems used onboard ships to comply with MARPOL for reducing marine pollution.

The presence of NO<sub>x</sub> in marine engine's exhaust emission is due to high combustion temperature which reacts with nitrogen in the air supplied for combustion. Read more about it [here](#).

Following are the methods to reduce NO<sub>x</sub> emission from ship:

1. **Humid Air Method:** In this method, water vapour is mixed in the combustion air before supplying it to the cylinder. Air from the T/C blower is passed through a cell that humidifies and chills the hot air taking moisture from the cooling water until air saturation is achieved. Generally saline sea water is utilized in this method by heating it with jacket water and turbo charger heat, and the left over brine is disposed back to the sea. This method can achieve reduction of NO<sub>x</sub> by 70-80%.
2. **Exhaust Gas Re circulation (EGR):** As the name suggests, some amount of engine exhaust gases are send back to the scavenge space to mix up with the air be supplied to cylinder for combustion. This reduces the oxygen content of the air and hence reduces formation of NO<sub>x</sub>.
3. **Water Injection and Water emulsion:** In this method, water is added to reduce the temperature of combustion leading to low

---

NOx emission. In water emulsion, fuel is blended with water and in water injection a separate fresh water injector is mounted in the cylinder head which injects water. This method has a drawback of increasing the specific fuel oil combustion with reduction in NOx by only 20-45%.

4. High Scavenge Pressure and Compression Ratio: With high scavenge pressure and compression ratio, large amount of air can be introduced inside the cylinder to lower combustion temperature and NOx emission.
5. Selective Catalytic Reduction: The SCR is the most efficient way to reduce NOx emissions from ships (up to 90-95% of reduction). In this method, low sulphur fuel oil is used and exhaust temperature is maintained above 300 deg C. The exhaust gas is mixed by water solution of urea and then it is passed through catalytic reactor. The only disadvantage of SCR is its expansive installation and operating cost.
6. Two Stage Turbocharger: ABB's latest two stage turbocharger can reduce the exhaust temperature in the intercoolers and also the NOx content in the emitted exhaust.
7. Engine Component Modification: It is better to design an engine which has a property to reduce the NOx formation during combustion process rather than investing on expensive secondary measures. Integration of slide valve type fuel injector with almost zero sack volume eliminates any chance of fuel dripping and after burning, leading to cylinder temperature and NOx formation. New designs like Green Ultra long stroke engine from MAN (GME series) with reduced mean piston speed gives more time for excess air and proper combustion to lessen NOx formation.

SOx or sulphur oxides are formed during combustion process in the engine because of presence of sulphur content in the fuel. Read More about it here. Following are the methods and technologies used to reduce sulphur emission from marine engines:

1. Use of Low sulphur fuel oil: It is expensive but most commonly used method to comply with Annex VI of MARPOL while entering emission controlled Area or ECA.
2. Exhaust Gas Scrubber Technology: The exhaust gas from the engine is passed through the scrubber tower where a liquid is

---

showered over it. Fresh water blended with caustic soda (NaOH) is used as a scrubbing liquid which reduces the SO<sub>x</sub> to 95%. The scrubbing water is then sent to a water treatment effluent emulsion breaking plant after which it can be discharged overboard.

3. Cylinder Lubrication: Good quality cylinder lubrication along with efficient control systems such as Pulse or Alpha lubrication systems can neutralise the sulphur in the fuel and reduce SO<sub>x</sub> emissions from the engine.

## Ballast Water Treatment Systems (BWTS)

Ballast Water Treatment System (BWTS) is a system designed to remove and destroy/inactive biological organisms (zooplankton, algae, bacteria) from ballast water. Ballast water treatment is still evolving technology with an ever-growing number of manufacturers. This means that there is limited inservice experience for the systems being offered and there is a general understanding that no single system is suitable for all ship types.

## Marine fuel management (MFM)

Marine fuel management (MFM) is a multi-level approach to measuring, monitoring, and reporting fuel usage, with the goals of reducing fuel usage, increasing operational efficiency, and improving fleet management oversight. MFM has grown in importance due to the rising costs of marine fuel and increased governmental stresses to reduce the pollution generated by the world's fleet.

Effective MFM requires that you know:

- How much fuel is likely to be used?
- How much fuel is used?
- How the fuel was used?
- What things impact fuel usage?
- And by how much?

Manual methods of measuring fuel usage, i.e. fuel tank dipping or sounding, typically do not tell how much fuel was used:

- Traveling versus idling while in port or on station
- By a specific engine (port versus starboard, for example)
- Performing one job versus another
- By crew A versus crew B on similar voyages

Without a clear understanding of how fuel is being used, there is no operational baseline from which to compare any kind of fuel conservation tool or activity. Without a baseline, there is no way to determine if conservation strategies are actually working.

MFM allows a fleet owner to track actual fuel consumption and relate fuel consumption to the work performed by the vessel. It supports the analysis of the effectiveness of operating strategies and helps develop a clearer understanding of how well a vessel uses its fuel.

---

## **MFM Main Functional Areas**

- Operational Performance
- Engineering and Maintenance Management
- Management Oversight

### **Operational Performance**

Operational performance includes those functional areas that impact the actual performance of a vessel or fleet. It includes fuel monitoring, inventory control, accounting, and engine throttle management.

### **Fuel Monitoring**

Many marine vessels do not provide a way for captain and crew to measure and monitor fuel usage while underway. An optimum system onboard would include the ability to instantaneously monitor fuel burn rates from the wheelhouse. Individual engine and generator burn rates would be included, as well as fuel tank levels. This proactive monitoring would allow the crew to make decisions that positively impact fuel burn rates and efficiency.

### **Inventory Control**

Fuel tanks need to have sensors installed that continuously monitor levels as fuel is taken onboard and burned by engines and generators. Periodically measuring tank levels using traditional manual methods is not accurate enough or timely, given the volumes of fuel that a marine engine can consume. Flow meters or gauges should be installed on transfer lines where fuel is taken onboard or off-loaded.

### **Accounting**

In some parts of the world, fuel theft is an ongoing concern. Consequently, the accurate measurement of fuel taken on board coupled with the fuel actually consumed by engines and generators, is an important part of MFM. Flow meters should be installed in all fuel transfer lines so accurate fueling data can be captured. This data can then be compared with burn rates to determine whether fuel is being transferred off the vessel secretly. Beyond fuel theft, many governmental jurisdictions require that all fuel spill incidents be recorded and reported to the local authorities. For example, the Marine Department of the Government of Hong Kong has specific guidelines for responding to accidental marine fuel spills which reflect international requirements as promulgated by MARPOL, the International Convention for the Prevention of Pollution

---

From Ships. Additionally, accounting for fuel usage at various points along a voyage provides the ability to tie fuel burn and its associated costs to shipping or container rates. For example, understanding how a vessel burns fuel on certain parts of a voyage, allows the more accurate bidding of container rates so profit margins stay healthy. Consequently, varying shipping rates based on documented fuel usage rates can allow a shipper to bid more aggressively. A modern marine fuel management system would help in monitoring fuel usage, fuel transfer bunkering events and could be configured to sound an audible alarm when refilling fuel tanks might lead to a spill.

## Throttle Management

Vessel operators have the most control over fuel usage by the way they use the engine(s) throttle. Wind, current, hull condition, load, and propulsion system health can all impact fuel burn both positively or negatively. Some operators choose to lower engine speed, and hence vessel speed, in an attempt to save fuel. However, engine RPM and vessel speed alone are not indicative of total fuel consumption, so arbitrarily lowering engine speed does not guarantee fuel savings. One must do the workflow calculations on how the propulsion system is operating under existing changing conditions and then tie that to fuel consumption. Simply lowering engine RPM does not guarantee an optimum vessel speed setting based on conditions. Some modern fuel management systems are designed to perform these calculations while underway and make recommendations to the vessel master.

## Engineering and Maintenance Management

As with any capital asset, manufacturers typically include the standard maintenance practices and procedures needed to keep the asset functioning properly and within design specifications. In many cases, scheduled maintenance routines are based on laboratory or design parameters and do not necessarily represent the optimum. MFM supports proper maintenance on marine engines and generators by using the actual fuel burned or hours operated as the basis for performing maintenance routines. This condition-based maintenance program more accurately reflects the operating environment of the engine, but more importantly, reduces or eliminates unnecessary maintenance work.

---

## Management Oversight

Management functions within MFM include:

- Vessel performance analysis and overall fleet performance
- Crew analysis with emphasis on applying lessons learned as best practice across the fleet
- Key Performance Indicator gathering across the fleet to include fuel burned per mile or per ton; throttle settings at various points on a voyage; engine RPMs and exhaust gas analysis; and vessel performance against hull conditions
- Fuel management from purchasing to transfers to usage
- Chartered vessel fuel performance and adherence to contractual obligations

## Ship performance measurement

For most ships delivered from a shipyard there is a diagram showing the relation between speed and required power for one or more loading conditions, under standard conditions of trim and weather. But the ship owner knows that this speed cannot be maintained for the daily commercial operation and defines a service speed for the ship, which takes into account the power reductions due to weather, marine growth and hull surface fouling. Hence this relation between speed and power for a ship in service will give its performance.

Alternatively, this can be inferred from the specific fuel consumption of the engine, which has to increase to maintain same speed under conditions of reducing power. Ship performance management system is an integral part of every ship these days.

### Monitoring of vessel performance

Most ship operators/owners have a standard procedure for monitoring ship performance onboard. One of the ways is by measuring the daily fuel consumption and the daily distance covered. In this way, the daily mean power and mean speed may be calculated, and the result may be plotted in the speed/power diagram for comparison with the trial results.

Most ship operators/owners have a standard procedure for monitoring ship performance onboard. One of the ways is by measuring the daily fuel consumption and the daily distance covered. In this way, the daily mean power and mean speed may be calculated, and the result may be plotted in the speed/power diagram for comparison with the trial results.

Alternatively, procedures have been derived for more precise measurements with longer intervals, for instance once a month. For this a fair weather day may then be chosen. When the vessel is driven by a slow running diesel engine, the power could be measured by the cylinder indication, and speed may be measured over a period of say, one hour at constant power on a constant course. The result of such an exercise will be more accurate than one based on "noon data".

Other factors influencing the ship's performance are draft, temperature and salinity, weather conditions and sea current.

## **How the measured ship performance data is used?**

The most common method to process the data collected is to compare the observations of power and RPM to those data, which are found for similar weather and loading conditions from a mathematical model of the ships propulsion performance. The mathematical model is nothing but a set of relationships between the power /RPM of the ships model at a certain added resistance. Thus we get to know the added resistance, which if very high means that the ship surface may be fouled and therefore harms the performance of the vessel.

## **Conclusions**

The shipowner who understands this data and uses it stands much to gain from drawing affirmative conclusions about when the hull is fouled and when it needs to be dry docked and hull cleaning carried out. Thus without these performance reports, a shipowner may have to continually operate his vessels at a required charter speed in the face of diminishing power output and increasing fouling in the hull, resulting in increasing fuel consumptions.

From past experiences it has been found that for a ship consuming 100 tons/day, a saving of 10 ton/day is possible with timely remedies against increasing added resistance and therefore save \$6000 per day or up to \$1.6 Million per year!!

With ever increasing fuel prices, more emission control requirements in the offing and the essentiality for defining life cycles of hull coatings, the future is not far off where shipowners and operators concentrate on ramping up their efforts to minimize fuel consumption, reducing emission and improving vessel performance.

## Repair shipyards located at the Baltic Sea

Riga Shipyard

Within every ship repair area there are "cheaper" regions: In Northern Europe these areas include Poland, the Baltic States (Estonia, Lithuania and Latvia), and Russia. E.g. Remontowa in Gdansk has developed to a well reputed shipyard for any kind of repairs and sophisticated conversions.

With the opening of the Danish Storebælts Bridge in 1998 with a maximum allowable air draught of 63m the access to special but lucrative repair jobs has been reduced.

In 2010 midsized Fredericia Shipyard A/S moved from the Port of Fredericia to the large scale shipyard facilities, which were taken over from the closed newbuilding shipyard Odense Staalskipsvaerft (Maersk Group). On this occasion the company name was changed to Fayard A/S. Part of their comprehensive facilities is a huge 415 m x 90 m graving dock.

# North Sea & Atlantic

## Repair shipyards located at the North Sea and Atlantic

Peters Werft

The North Sea area is graced with plenty of repair facilities for all different kind and sizes of vessels. However this area is relatively high priced. Consequently 'haircut and shaving' jobs with big ships which are trading intercontinentally are mostly awarded to shipyards in low cost areas. It is also a matter of ship sizes, especially with container ships. Ships of more than 15,000 TEU hardly find a docking facility in this area any more.

For vessels over 30.000 dwt Lisnave in Portugal is the leading shipyard in terms of vessels drydocked.

# West Mediterranean Sea

## Repair shipyards located at the West Mediterranean Sea

Fincantierie-Sestri Ponente Shipyard Genova

The biggest dock in the entire Mediterranean area and one of the biggest in the world, became fully operational in 2017 in Marseille. Operated by Chantier Naval de Marseille (CNdM), Dock No. 10 is ready to accommodate all types of vessels thanks to its 465 m length and 85 m width. Main clients will be big cruise vessels. Consequently San Giorgio del Porto, parent company of CNdM and headquartered in Genoa, Italy, has sold a 33.3% share to major cruise operator Costa Crociere (Carnival Group) in 2016.

Palumbo Shipyards, a multinational group based in Naples, is the largest shiprepair & conversion network in Mediterranean serving the region with eight shipyards. The group can count 18 dry docks up to VLCC size.

Many Spanish shipyards on the Mediterranean side of the country are also very much engaged in repairs and conversions.

In the entire Mediterranean cruise ships and super yachts play an important role for the ship repair industry.

## East Mediterranean & Black Sea

## Repair shipyards located at the East Mediterranean Sea

Tersan Shipyard

Greece as the most important shipping nation in the region is suffering from not being competitive in the ship repair business. COSCO, which has bought a major stake in the port of Piraeus in the recent Greek crisis, is about to develop the port into a ship repair hub for the Eastern Mediterranean. The Piraeus Port Authority has received the new PIRAEUS III floating dock of 22,000 tons lifting capacity, which can serve ships up to 240 m length, 35 m width and 80,000 dwt. The new dock is expanding the existing infrastructure, aiming at attracting more ships to the ship repair zone of Perama from the wider region of the Mediterranean.

Within the region Turkish yards are taking most of the repair business. The country's shipyard industry which consists out of modern quality-certified shipyards able of carrying out extensive repair and conversion works is highly concentrated in the Sea of Marmara, particularly in the eastern part around Tuzla and Yalova. There are currently more than 70 shipyards under operation with 600 Million USD per year as average income from repair and maintenance.

Important players in the Black Sea for ship repairs are Damen Shipyards Mangalia and Daewoo Mangalia Heavy Industries. They are making use of the lower wage level in the Black Sea.

On the southern side of the Eastern Mediterranean Egyptian Ship Repairs & Building in Alexandria, Egypt, is offering floating dock facility with lifting capacity of 9,000 tons and 167 m length and 26.8 m beam.

## Repair shipyards located at the Red Sea and Persian Gulf

Albwardy Marine Engineering Fujairah

A large ship repair facility in the Red Sea is still missing. Only two repair yards with limited docking capabilities are available in Jeddah and Suez.

Jeddah Shipyard can facilitate drydockings of vessels up to 45,000 dwt, repair and maintenance of mechanical & electrical systems, pipe work and hull repairs.

Suez Shipyard Company, an affiliation of the Suez Canal Authority, is located at the southern entrance of the Suez Canal for 150 years. The company has a floating dock which is said to be one of the largest dock in the world with a capacity of 55,000 tons, 302 meters in length and 55 meters in width.

There are three major players in the Persian Gulf:

Drydocks Worlds Dubai shipyard was conceived and developed to address the repair needs of oil tankers traversing the Gulf region. Ship repair remains the core business of the yard. Its service portfolio includes ULCCs and VLCCs, bulk carriers, container-ships, ro-ro vessels, cargo vessels, gas carriers, chemical tankers, offshore vessels and rigs.

ASRY Shipyard in Bahrain, founded 1977, can offer 500,000 dwt drydock capability and two large floating docks. The yard's portfolio includes also servicing offshore platforms.

Saudi oil major Saudi Aramco is developing a \$5.2 billion maritime and shipbuilding complex in the Persian Gulf. Once completed, the 1.7 square mile complex will be the largest yard of its kind in the Arabian Gulf and will offer a range of services from large shipbuilding and ship repair, offshore rig fabrication, and offshore support vessel repair.

---

## Indian Ocean

## Repair shipyards located at the Indian Ocean

Colombo Dockyard PLC

The area comprises Oman, Pakistan, India, Sri Lanka, Bangladesh and Myanmar. Thereof Sri Lanka is strategically best located with just a short deviation from the direct route between the Malacca Strait and the Suez Canal. Colombo Dockyards is capable of taking vessels of up to 125,000 dwt into drydock.

Also South Indian state owned Cochin Shipyard is conveniently located. This shipyard has also set up a dry docking base at Mumbai Port. But drydocking facilities for ship repairs in India are generally far from adequate as compared to newbuilding capacities. Hence, the country's ship repair industry is no match for the global competition. Certain policy measures have been undertaken by the government towards ship repairs, however, it is a long road for the industry to be internationally competitive in this segment.

Among the areas where India loses the battle to bag global ship repair order is lack of availability of spares within the country as most of the Original Equipment Manufacturers (OEMs) are foreign-based. Other reasons for the global players not finding Indian peninsula attractive for repairs are time delays and cost overruns. On the other side most of the sub-contractors in Dubai and Singapore are from India. There is a huge Indian diaspora of workers, supervisors and managers currently employed outside and are willing to return. The challenge is for the Indian industry to attract them.

Since 2013 Oman Drydock Company (ODC) as the first ship repair company in Oman is under operation. It has been working exclusively with DSME (Daewoo Shipbuilding & Marine Engineering Co.,Ltd.) to develop its world-class drydock and yard complex at Duqm Port; primarily for the overhaul and conversion of large commercial vessels. The complex has the capacity to handle vessels of all sizes, including VLCCs of up to 600,000 dwt.

## South East Asia (China, Vietnam)

## Repair shipyards located in South East Asia

CSBC Cooperation

Since the opening up of the Chinese economy there has been considerable expansion in its ship repair and ship building capacity on account of low labour costs and investment incentives. Chinese yards are also continuously improving quality, expertise, productivity and broadening the range of work that they can undertake. Chinas repair yards are all experiencing very high levels of utilisation and are suffering from shortages of skilled labour that is affecting the industry as a whole, and will need to reach further into its labour pool in order to find skilled employees. The countrys largest single repair yard is located on Mazhou Island in the Pearl River delta, near the growing port of Shenzhen and is operated by the well-established Chinese ship repairer Yiu Lian Dockyards

Vietnam is the most significant of the recent entrants in the worlds shipbuilding market, and is attracting considerable investment from foreign investors into its yards because of the support from the Vietnamese government, the availability of infrastructure and its large pool of skilled, low-cost labour. While it is understood that the majority of this foreign involvement is focused on newbuilding facilities, there will be an inevitable flow-on effect on other Vietnamese facilities; especially the older ones that may no longer be attractive for newbuilding construction, but which may find a niche by providing repair and conversion services.

## North America West Coast

## Shipyards located at the North American West Coast

The area comprises the west coast of the United States and Canada as well as Alaska and Mexico. Contrary to the East Coast of the U.S. the shipyards are concentrated on a few places only whereas the Navy business plays a significant role as well. With Nassco of General Dynamics and BAE Systems Ship Repair two strong industrial groups are part of the shipyard industry at the west coast. Vigor Industrial is another major local player with twelve sites in the Northwest and Alaska.

The Seaspan Group alone is running three shipyards at the Canadian west coast: Vancouver Drydocks (with two drydocks of 36,000 dwt and 30,000 dwt), Vancouver Shipyards and Victoria Shipyards (utilising the state owned graving dock for vessels up to 100,000 dwt at Vancouver Island) which is the biggest repair facility at the Canadian west coast.

## US Gulf

## Repair shipyards located at the US Gulf

Conrad Deepwater Shipyard

There are a lot of ship repair facilities in the U.S. Gulf thanks to the extensive offshore oil and gas industry which is exploring these resources from under the seabed. This industry has a very sophisticated approach to safety and documentation issues and the local shipyard industry is used to it. As a huge fleet of mid-sized auxiliary vessels are part of the local offshore industry a lot of ship repair facilities do exist for such vessel size.

Bollinger Shipyards as one of the biggest players in the local market comprises of twelve shipyards and forty drydocks all located in Louisiana and Texas.

With Hutchison Ports TNG (former Talleres Navales del Golfo SA) there is a shipyard which has been available on the Mexican side of the gulf for more than 80 years now. Located in the Port of Veracruz, it performs repair and maintenance works for vessels, rigs, barges and all types of maritime structures and equipment. The shipyard belongs now to Hutchison Ports as the worlds leading port investor, developer and operator with origins in Hong Kong.

# Carribbean Sea

## Repair shipyards located at the Caribbean Sea

This trading area comprises all countries surrounding the Caribbean Sea (incl. Cuba). The ship repair business in this region is very much influenced by the ever booming cruise industry which is its major area of operation. There are two dominating ship repair facilities operating:

Caribbean Drydock Company, Havana, has long been the only dockyard in the Caribbean during the colonial period.

Grand Bahama Shipyard which was founded only in 1999 with a single Panamax dock has grown from humble beginnings to become the world leader in refits, refurbishments and revitalizations especially for cruise vessels. The Yard is strategically located in Freeport, approximately 100 miles east of Miami, Florida (the 'cruise capital' of the world) along all the major shipping routes.

Damen Shiprepair Curaçao is strategically located in the Caribbean, en route to the Panama Canal, and outside the Hurricane Belt within a natural bay. In 2017, global player Damen Shiprepair & Conversion took over the management of the Curaçao Drydock Company, established in 1959. Under the new name it will continue offering a full range of services in maintenance, repair, refit and conversion of vessels and offshore constructions of all sizes.

## South America East Coast

A large container ship is sailing on the ocean, leaving a white wake. In the background, a city skyline is visible on the horizon under a blue sky with scattered clouds. A teal banner with white text is overlaid on the image.

## Shipyards located at the South American East Coast

The east coast of South America is providing some well established shipyards. The majority is expectedly located in Brazil as the largest country of the continent whose shipyard industry is benefiting from the huge national offshore industry. Rigs and the large and growing fleet of OSVs sailing in Brazilian waters demand quite some repair berths.

Brazil had adopted highly protectionist policies with crosssubsidies, which were channelled to develop the ship building industry.

Even pure ship repair facilities are being still jump-started: Nearly a billion USD are invested in Lucena, on the coast of the northeast state of Paraíba, for the installation of the Brazil Basin Drydock Company (BBDC). It is said that this new facility is designed to compete with the best repair yards in the world and will be the first dedicated ship repair yard for medium and large-sized ships in the South Atlantic basin. It is claimed that no other ship repair yard in the area will have respective resources. At its maximum capacity, it will be able to dock more than 120 ships per year.

## South America West Coast

## Shipyards located at the South American West Coast

The shipyard density at the west coast of South America is not that high as on the east coast.

ASMAR as one of the biggest players at the west coast is owned by the State of Chile, operating in the shipbuilding and defence industries, whose main activity is to provide maintenance and repair services for the Chilean Navy but also for domestic and foreign commercial vessels. The company has three industrial plants located in Valparaiso, Talcahuano and Punta Arenas having its corporate head office is located in Valparaiso.

SOCIBER is also located at Valparaiso. The yards main asset is the floating dock VALPARAISO III designed with a lifting capacity of 10.000 tons and allowing vessels up to 165 m length and 24.3 of beam to be dry docked. Additionally there is the possibility to berth vessels up to 170 m length alongside the floating dock.

MEC Shipyards is another international ship repair facility, strategically located in the Port of Balboa, Panama. The yard includes three graving docks for vessels up to Panamax size, with over 12,000 sqm of fully equipped workshops.

## West Africa

## Repair shipyards located in West Africa

Chantiers Et Ateliers Du Maroc

Despite its long geographical extension ship repair facilities for ocean going vessels are rather rare in this region.

Tema Shipyard Limited in Ghana and Dakarnave in Senegal which is an affiliated company of the Portuguese Lisnave group, can be considered as one of the leading ship repair facilities in this region.

Also Nigerdocks Shipyard in Lagos which claims to have the largest facility of its kind in West Africa can offer a 25,000 dwt graving dock for ship repair, maintenance and refurbishment.

Carena, a subsidiary of French logistics conglomerate Bolloré operates a ship repair yard in Abidjan/Ivory Coast. It has strengthened its operational capabilities with the acquisition of a third dock with a length of 175 m and a width of 26 m allowing vessels to be docked weighing up to 10,800 tons.

## South Africa

## Repair shipyards located in South Africa

While South Africa's ship building and repair industry is at a "critical" stage in its development, the industry continues to be stifled by obsolete port infrastructure, protectionist government policy and monopoly pricing, driving the migration of these businesses to other ports in Africa.

Domestic ship repairers had been "handicapped" by the shortage of drydock facilities in South Africa due to Transnet National Ports Authority's (TNPA's) commitment to a "common user" principle to maintain control over the entire port. While private ship companies are willing to invest in these facilities themselves, they cannot get permission from the TNPA, because of the government's commitment to the common user principle and the fact that they want to maintain control of access to port assets. This is a very different institutional model compared to most other ports in the world, which have large, vertically integrated shipyards that own or lease waterfront land and provide everything themselves. The South African ship repair market could be substantially larger and more profitable if TNPA invested more, or allowed private companies to invest in their own drydock facilities.

Repair facilities are mostly concentrated in Durban with four drydocks being provided thereof two by TNPA. In total seven repair facilities are offering their services to the shipping business.

In Cape Town also four docks are being provided (thereof two by TNPA and private ones). The biggest one has even a length of 360 m.

Also East London has a drydock of 200 m length whereas there is only one slipway available in Port Elisabeth capable of accommodating only fishing vessels and harbor tugs.
